Ernst Abbe (1840-1905)  
The “physical” diffraction limit

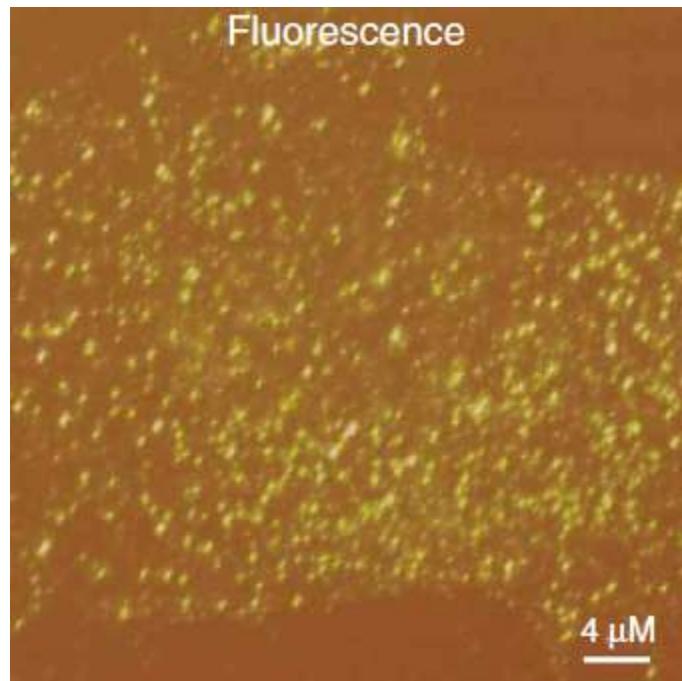

# 50 years to extend the resolution

- Confocal microscopy (1957)
- Near-field scanning optical microscopy (1972/1984)
- Multiphoton microscopy (1990)
- 4-Pi microscopy /  $I^5M$  (1991-1995)
- Structured illumination microscopy (2000)
- Negative refractive index (2006)

# Near-field scanning optical microscopy

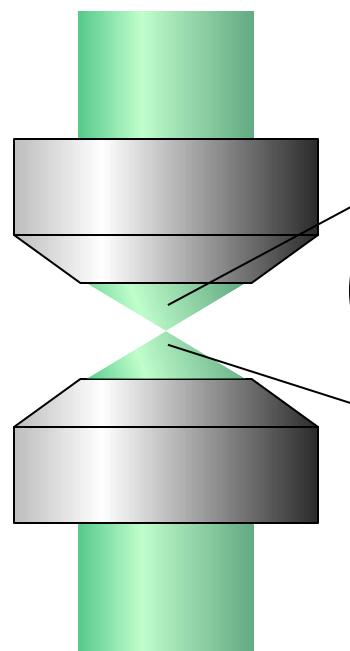

$\beta_2$  adrenergic receptor clusters  
on the plasma membrane

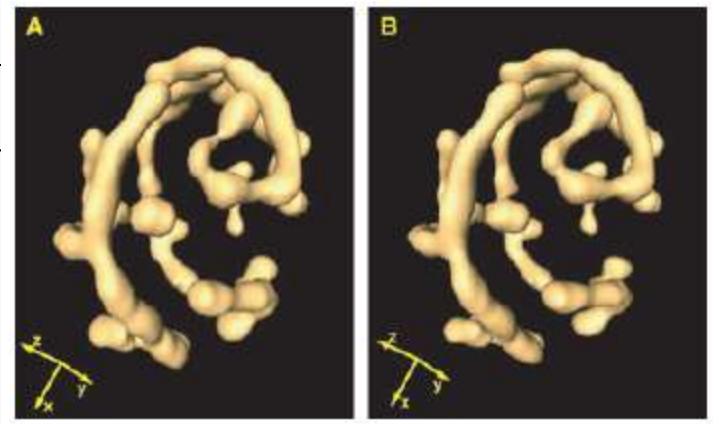

Ianoul et al., 2005

# 4-Pi / $\text{I}^5\text{M}$

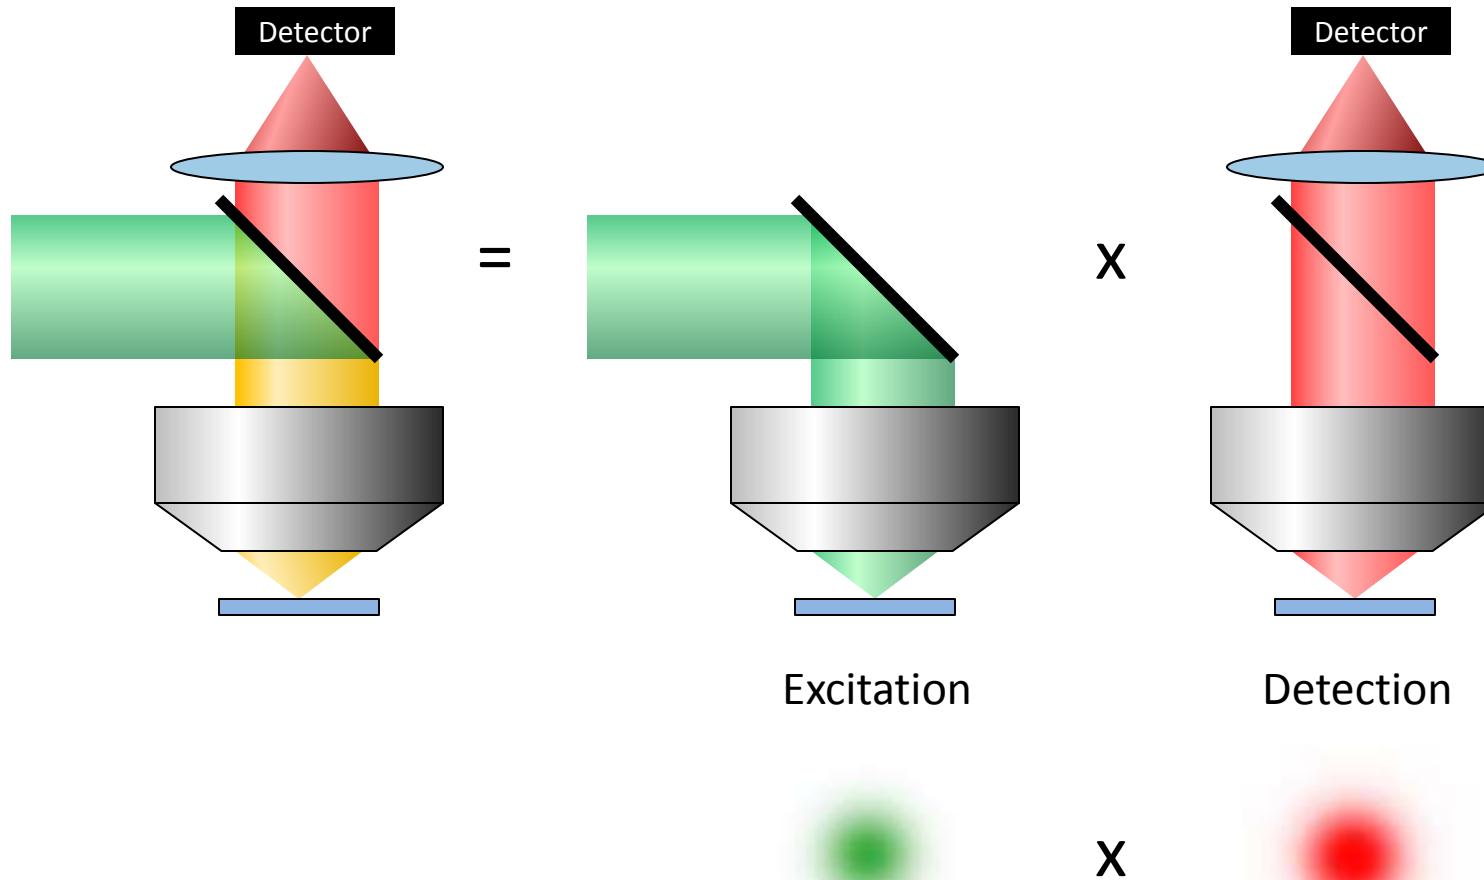

$$NA = n \sin \alpha$$

$$d \approx \frac{\lambda}{2 NA}$$

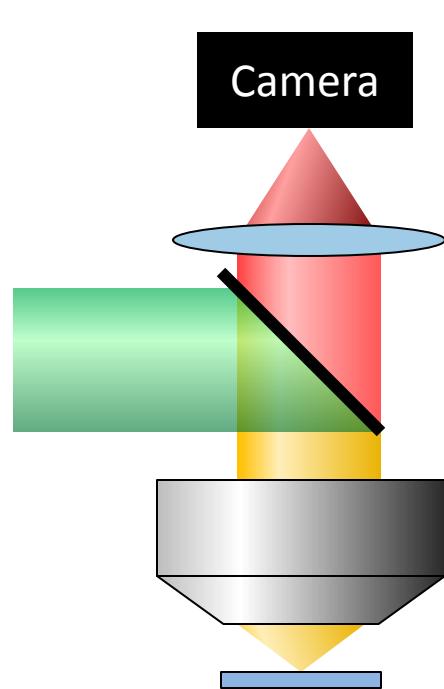

Major advantage:  
Similar z resolution as x-y resolution

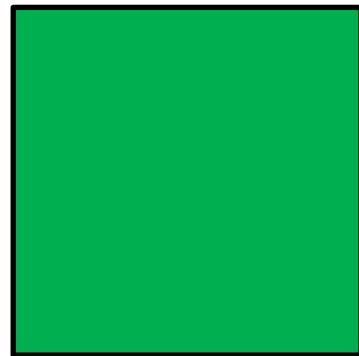

# Patterned illumination

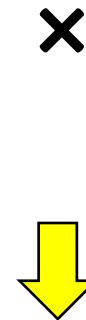

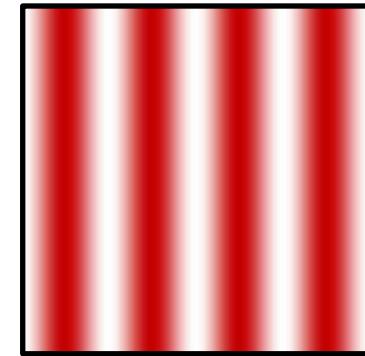

# Structured Illumination Microscopy (SIM)

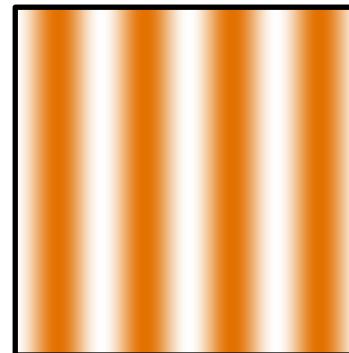

Wide field illumination

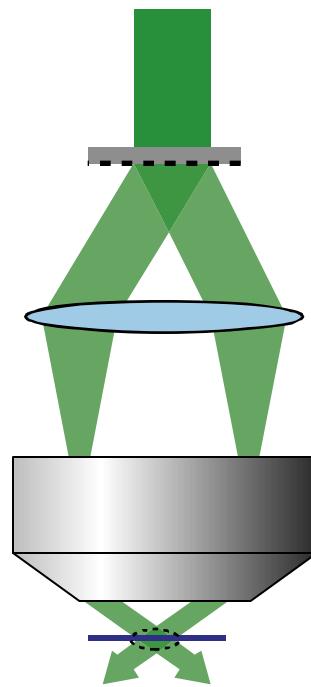

Diffraction-limited detection

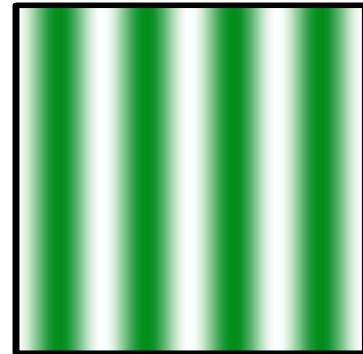

Diffraction-limited image

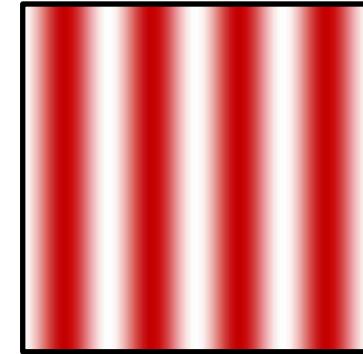

# Structured Illumination Microscopy (SIM)

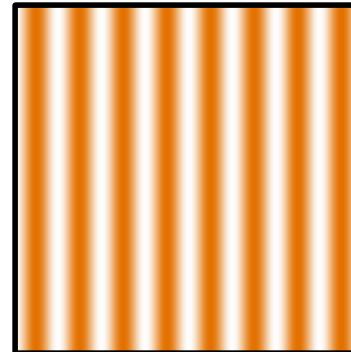

Structured field illumination

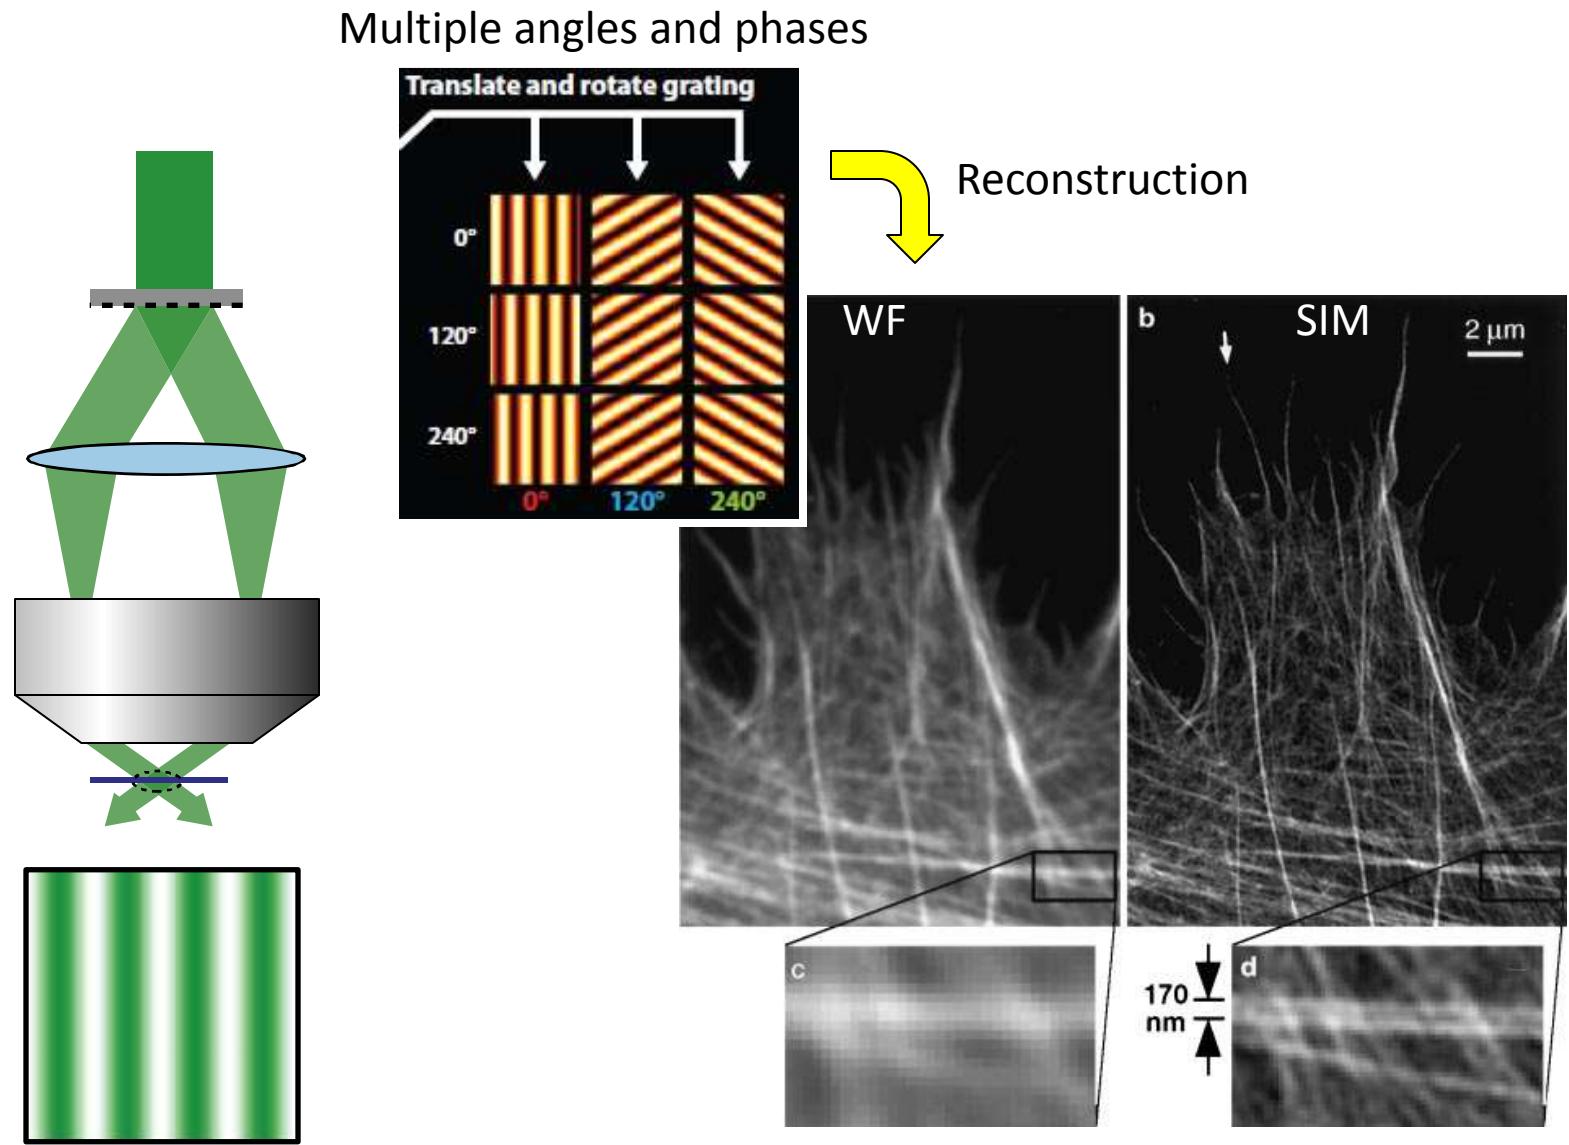

Diffraction-limited detection

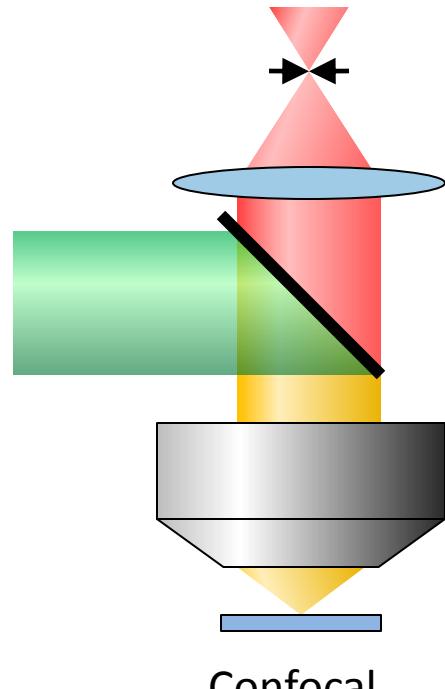

Diffraction-limited image

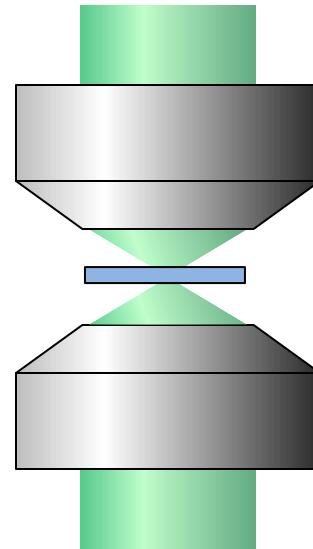

# Structured Illumination Microscopy (SIM)

# The diffraction limit still exists

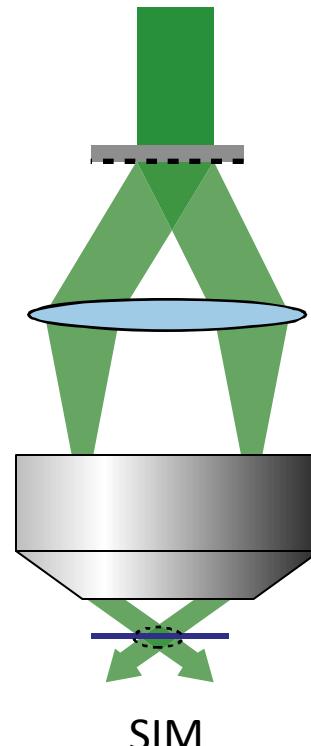

Confocal

$4\text{Pi} / \text{l}^5\text{M}$

$$d \geq \frac{1}{2} \cdot \frac{\lambda}{2NA}$$

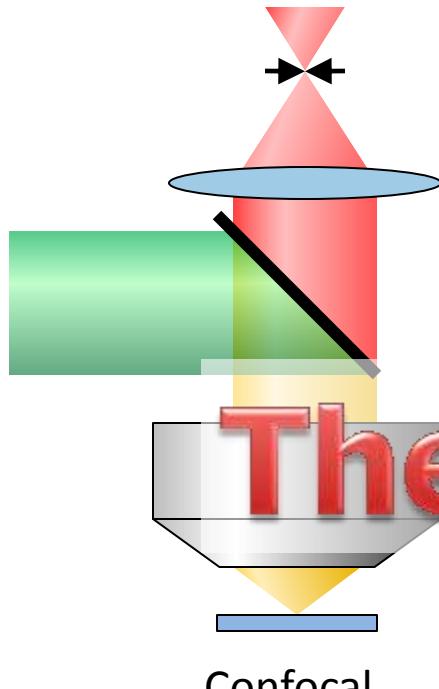

SIM

# Breaking the diffraction barrier

# Breaking the diffraction barrier

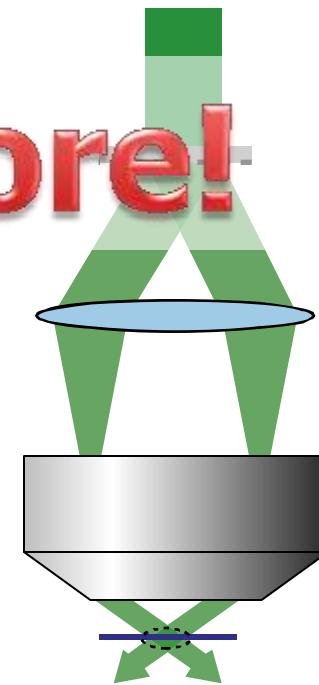

Confocal

The Fluorophore!

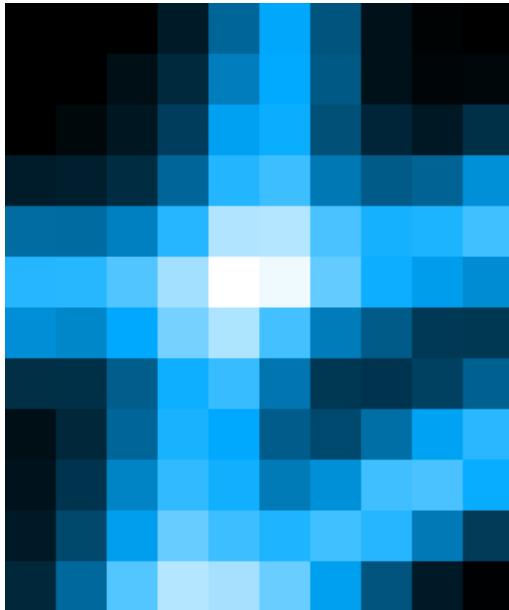

$4\text{Pi} / \text{I}^5\text{M}$

Diffraction limited excitation and emission

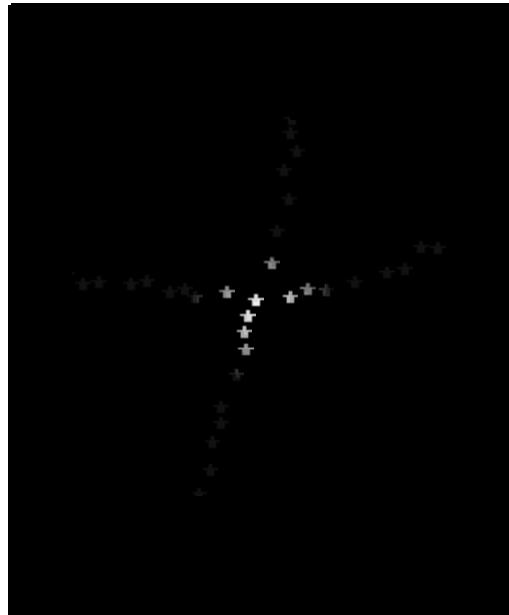

Doubled resolution

# Super-resolution by differential depletion

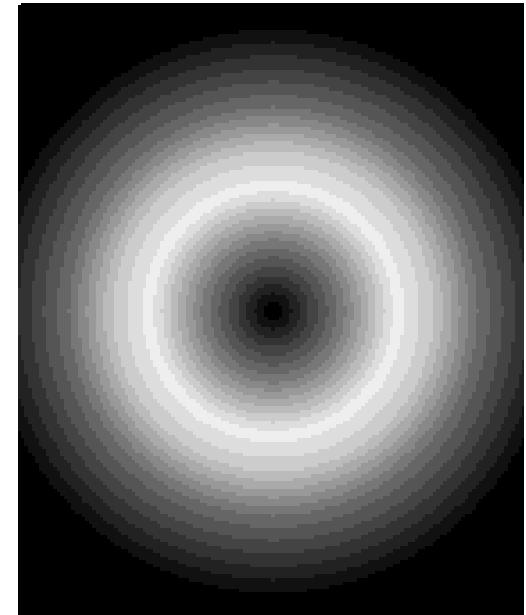

Fluorescence image

Underlying structure

Depletion pattern

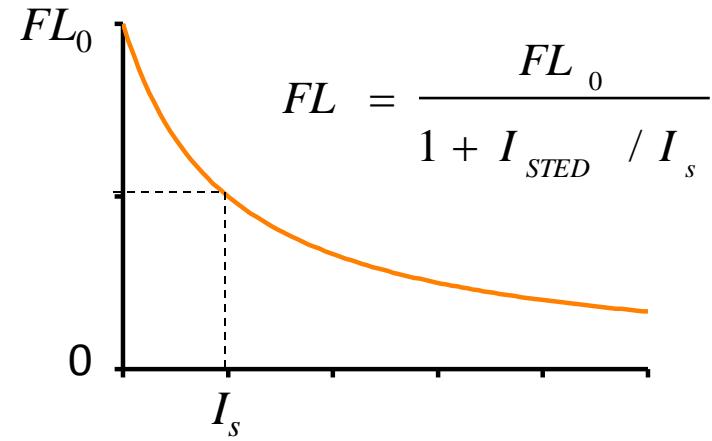

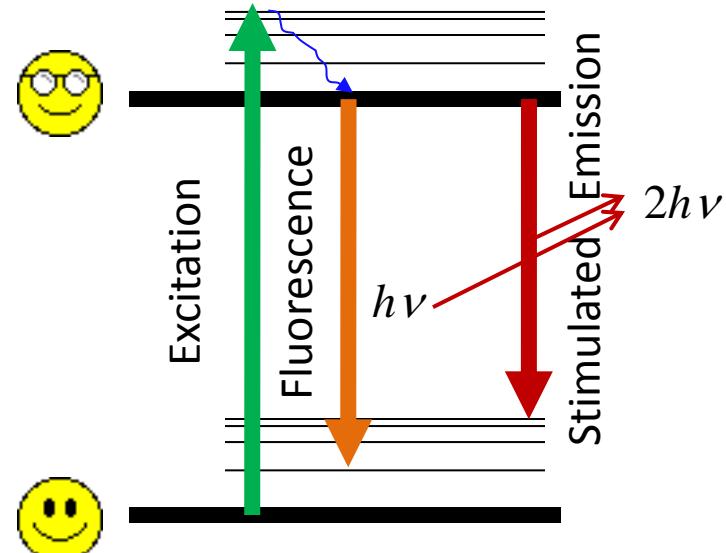

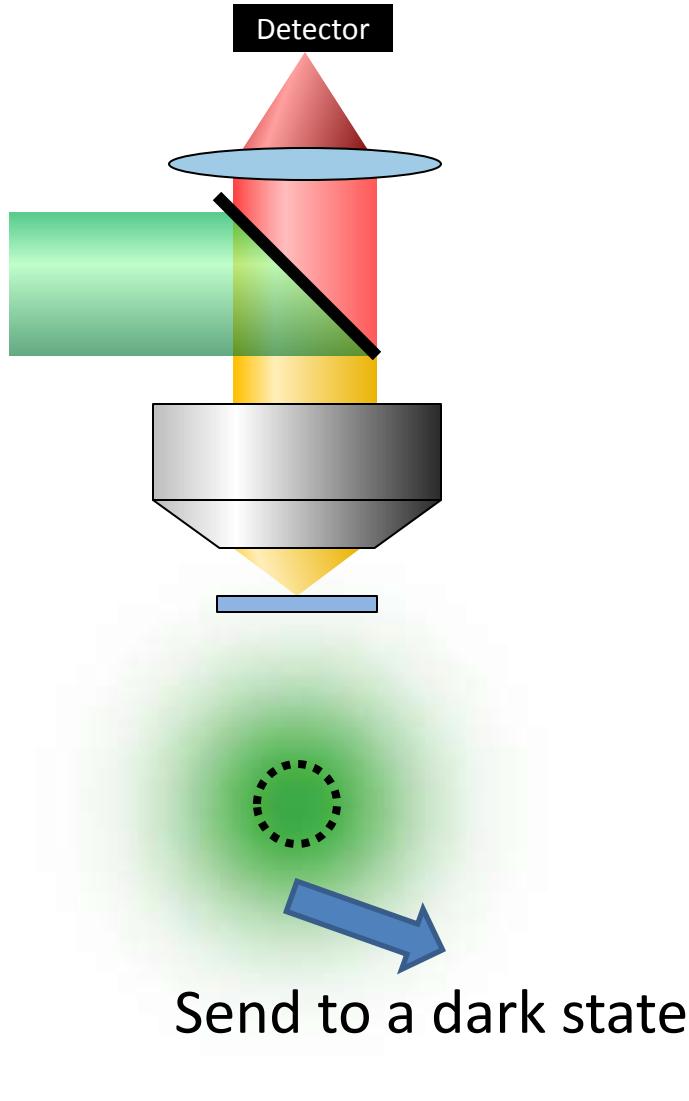

Diffraction limited PSF Saturated depletion = Smaller effective PSF

**STED** (Hell 1994, Hell 1999)

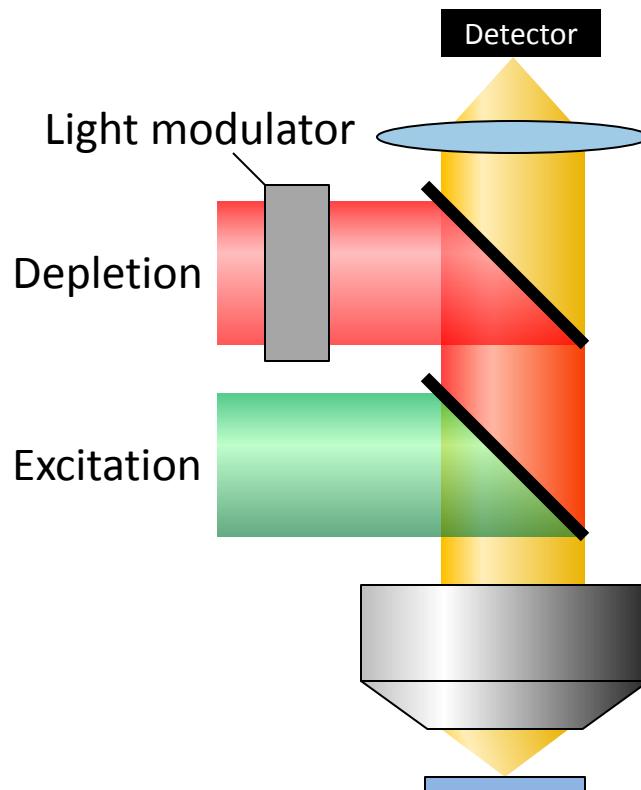

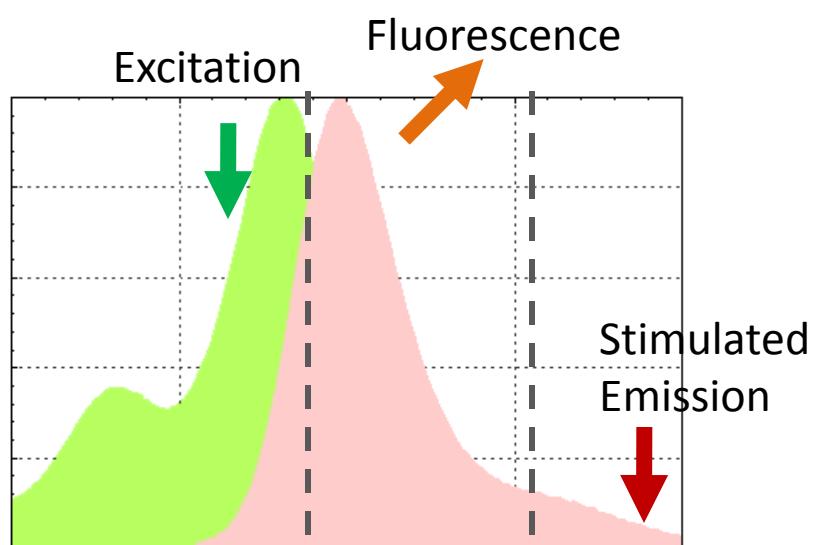

**GSD** (Hell 1995, Hell 2007)

**RESOLFT** (Hell 2003, Hell 2011)

# Stimulated Emission Depletion (STED)

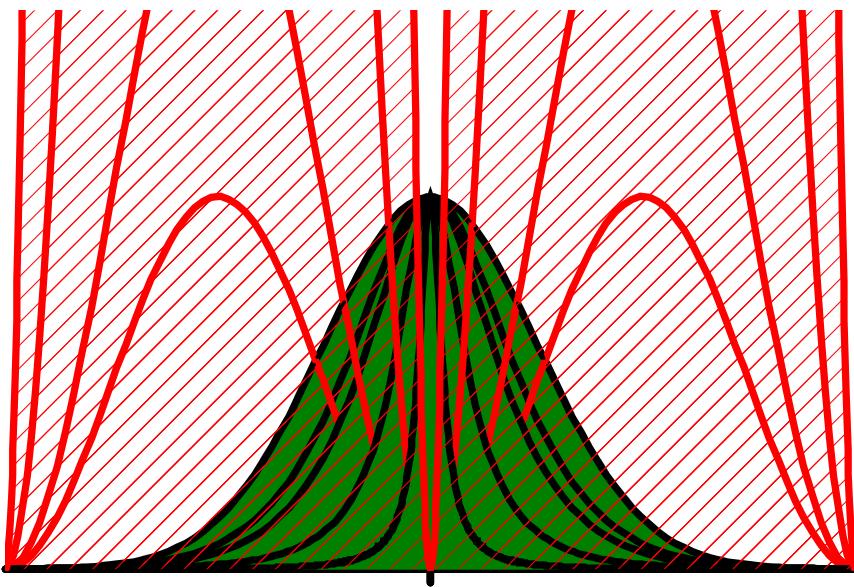

# STED microscopy

$$\text{Excitation} \quad \text{STED pattern} \quad = \quad \text{Effective PSF} \quad ?$$

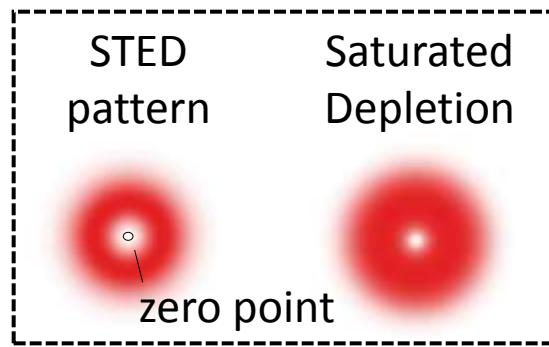

The diagram shows the mathematical relationship between the excitation beam, the STED pattern (a donut-shaped depletion beam), and the resulting effective point spread function (PSF), which is represented by a small green spot with a question mark.

# Saturated depletion

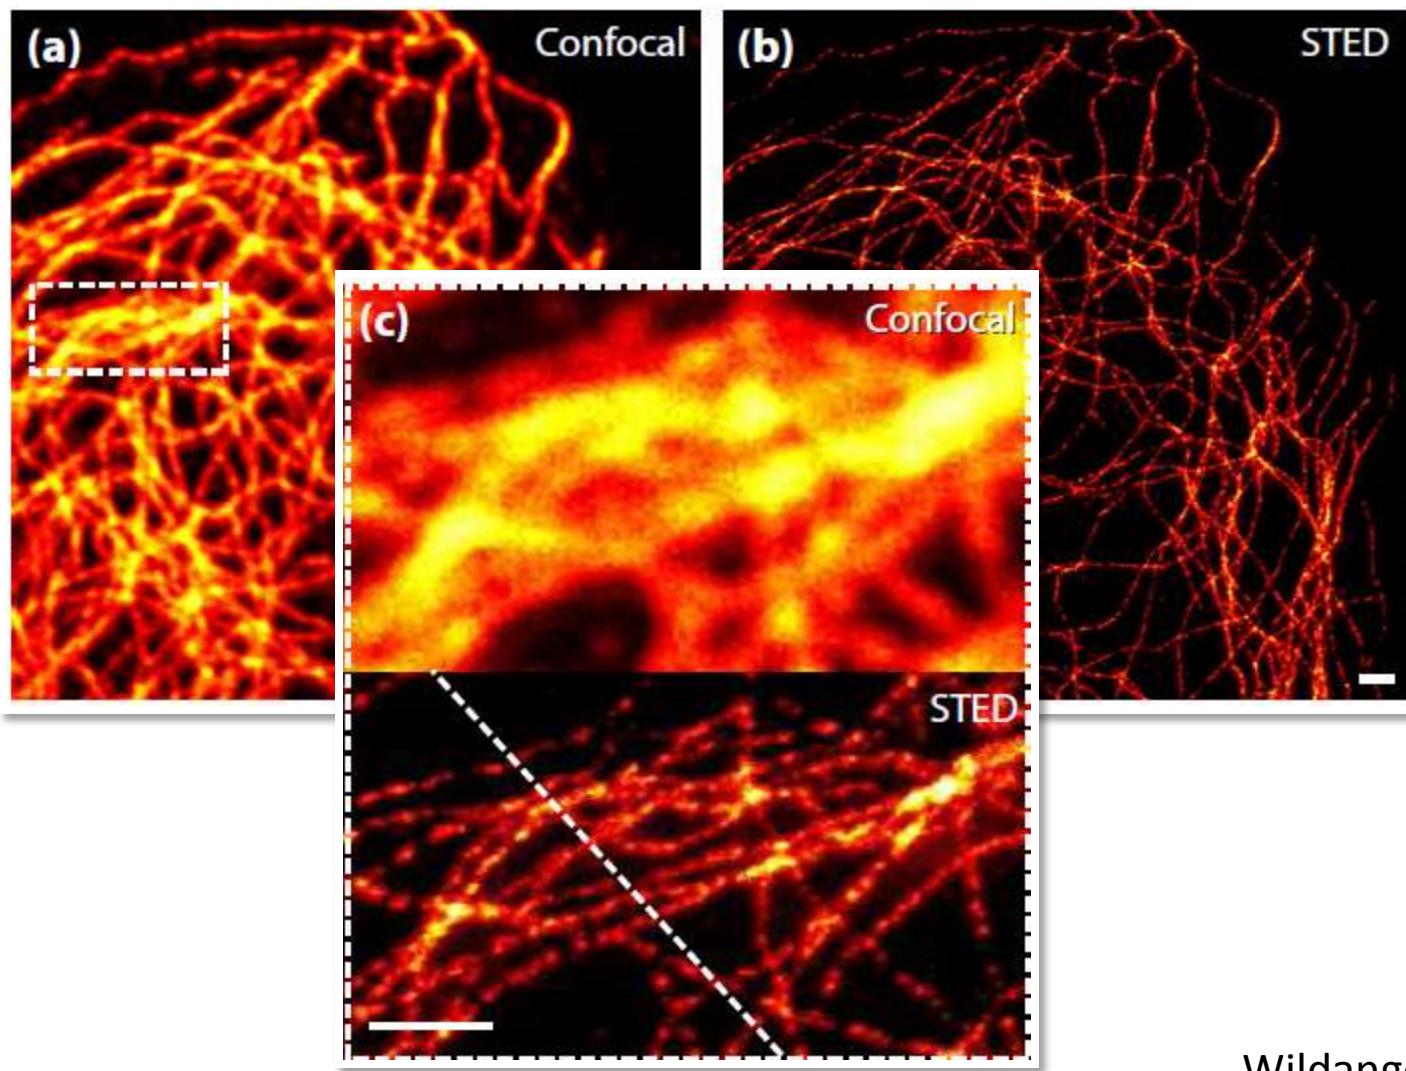

$$I_{\text{STED}} = I_s Q Q_S J_S$$

$$d = \frac{1}{\sqrt{1+I/I_s}} \cdot \frac{\lambda}{2NA}$$

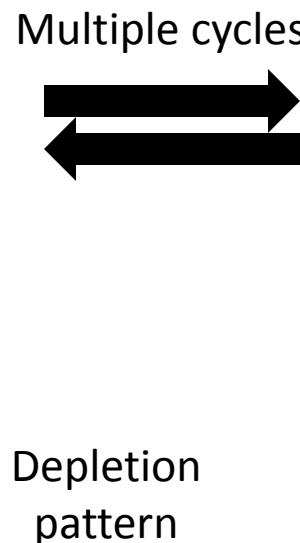

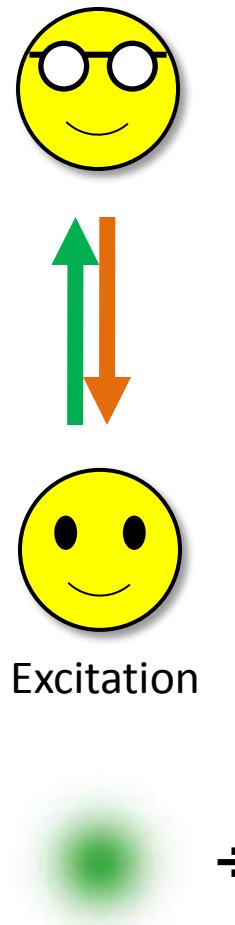

# STED images of microtubules

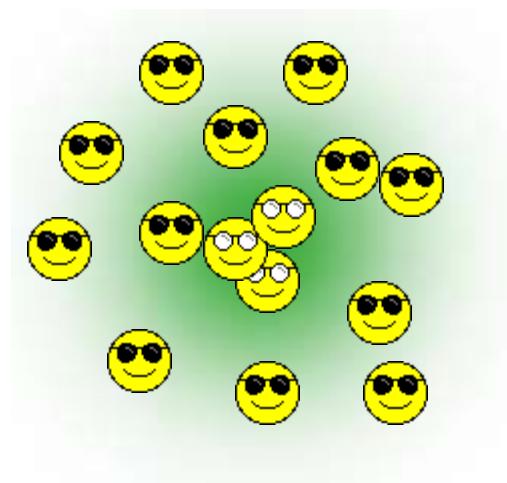

Wildanger et al., 2009

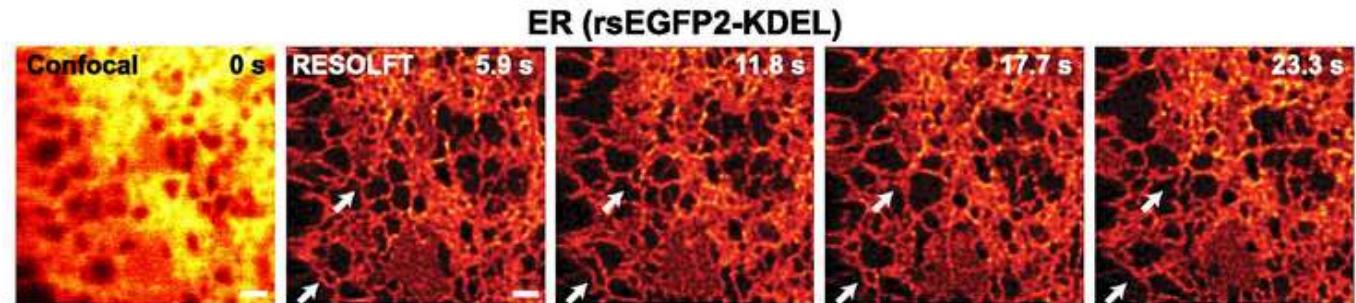

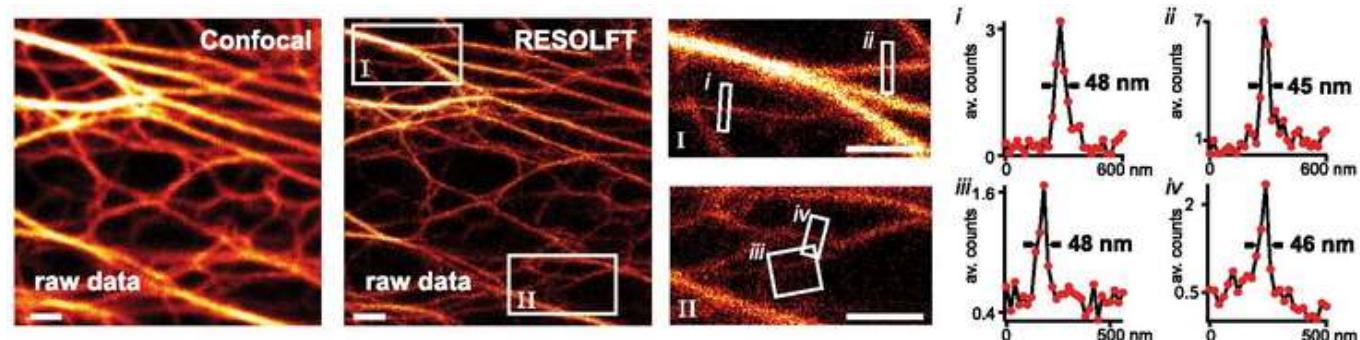

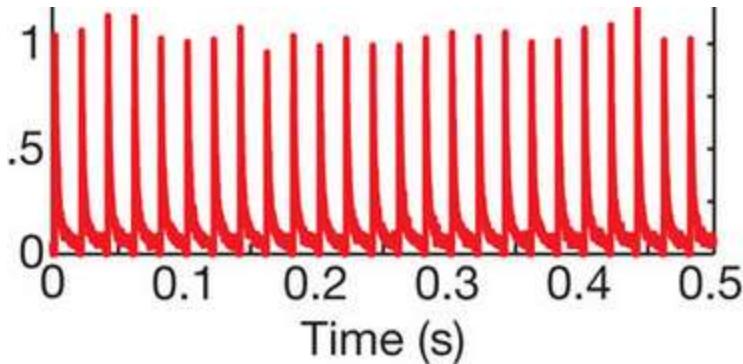

# The “patterned illumination” approach

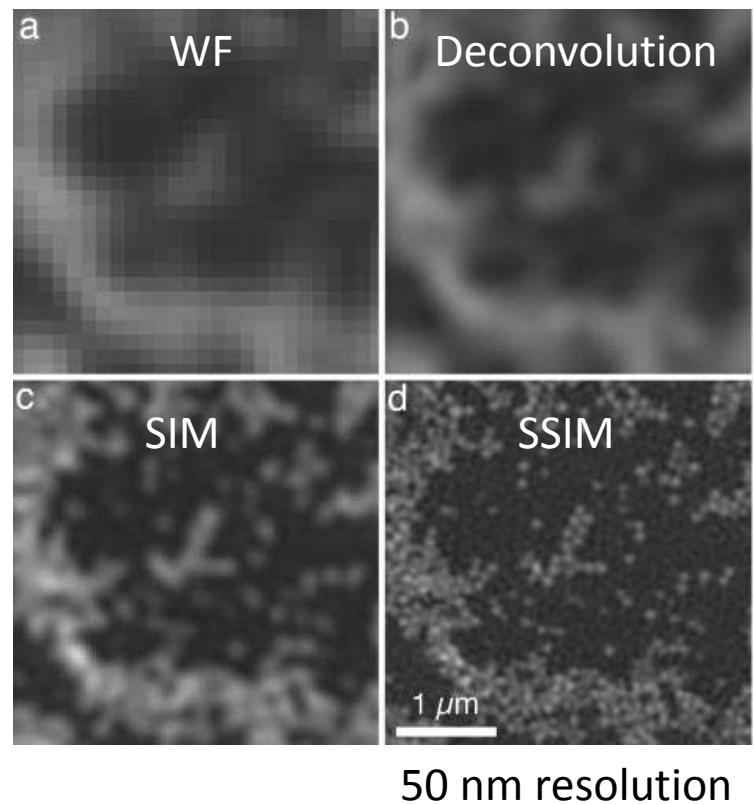

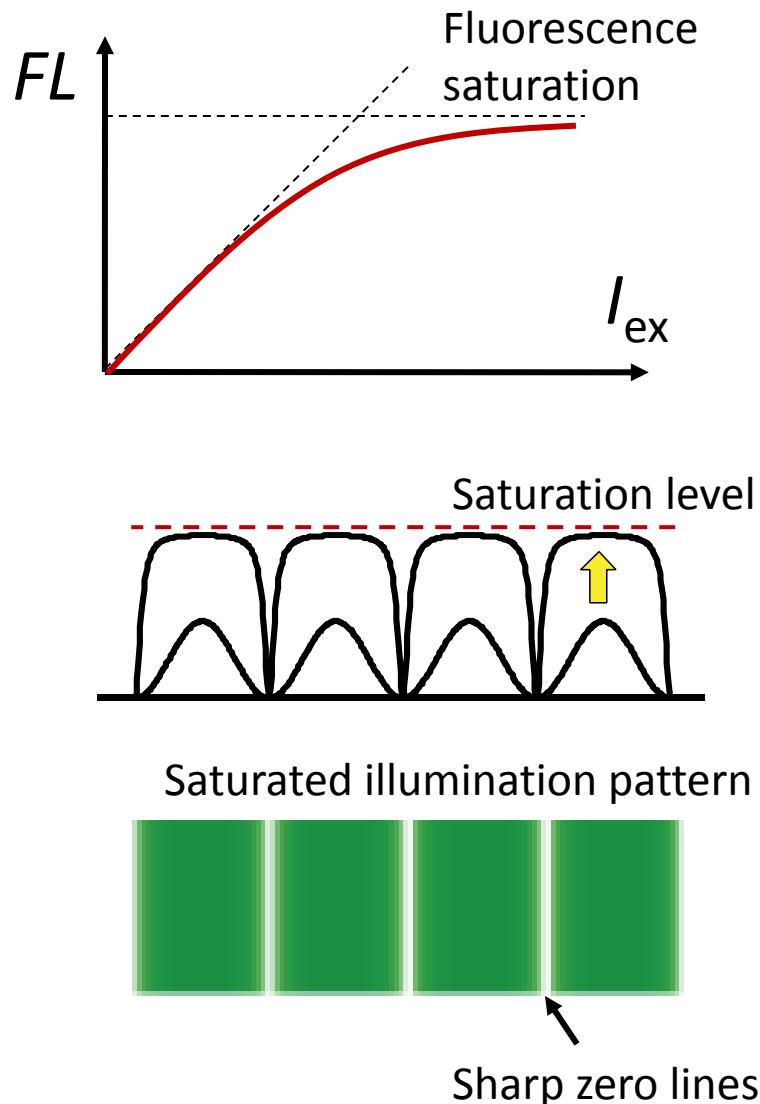

- Ground state
- Triplet state
- Isomerization
- etc.

# RESOLFT by rsEGFP and rsEGFP2

# Saturated SIM

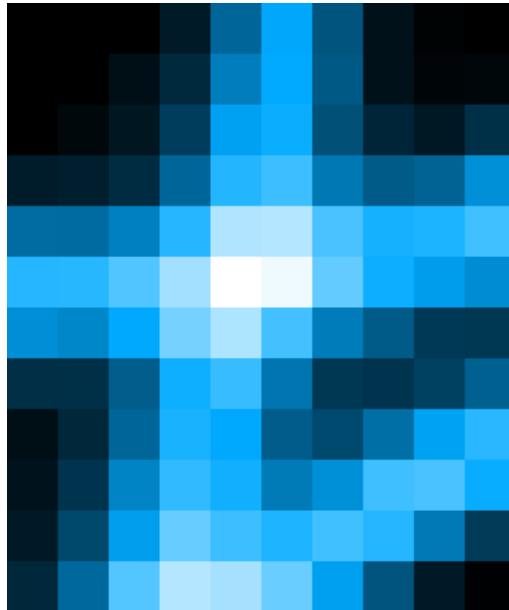

Suffers from fast photobleaching  
under saturated excitation condition

# Super-resolution by single-molecule switching

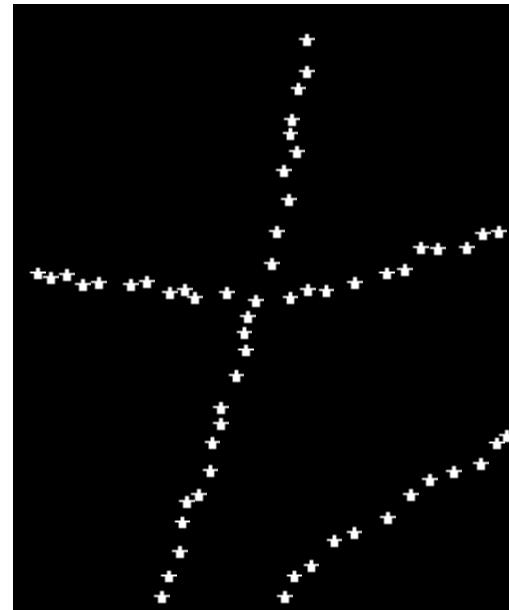

# Super-resolution by single-molecule switching

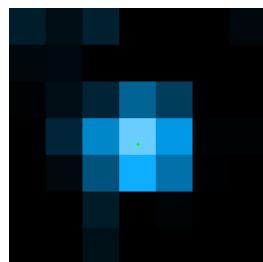

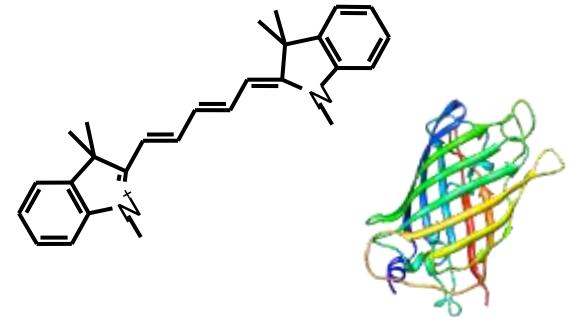

Fluorescence image

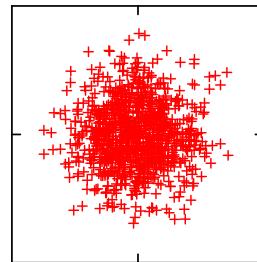

Underlying structure

Photoswitchable molecules

The limit of “Super-Resolution”

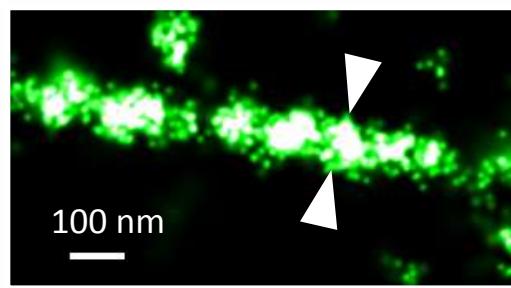

# Unbound theoretical resolution

$$D = \frac{d_{\text{Diffraction}}}{S}$$

- $S \approx \sqrt{N}$
- 6,000 photons for Cy5  $\rightarrow$  5 nm
- 1,000,000 photos for Hydro-Cy5  $\rightarrow$  < 1 nm  
(Vaughn et al., 2012)

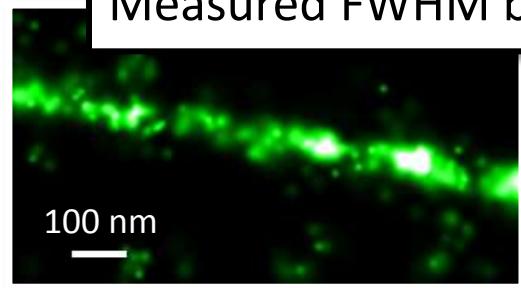

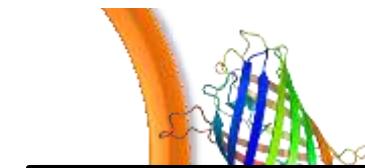

# Effective resolution: Probe matters

Antibodies:  
~ 10 nm

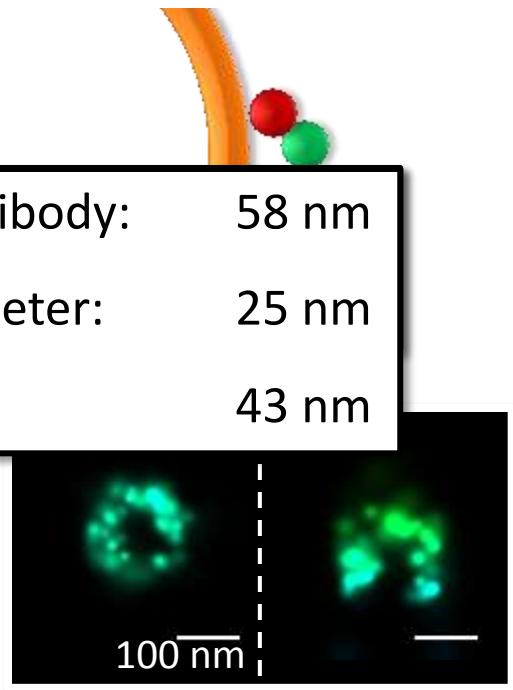

~ 6000 photons

Fluorescent Proteins:  
~ 3 nm

< 1000 photons

Small fluorophores:  
~ 1 nm

~ 6000 photons

Measured FWHM by antibody: 58 nm  
Actual microtubule diameter: 25 nm  
Measured FWHM by FP: 43 nm

# Fluorescent protein vs. Antibody

## Fluorescent protein fusion

- Live sample labeling
- High specificity
- High labeling efficiency
- Genetically encoded
- Lower S/N

## Antibody immunofluorescence

- Fixed sample

### Newer labeling methods

- Enzymatic tags  
SNAP-tag, HALO-tag, TMP-tag, etc.
- Nanobodies
- RNA aptamers

precision

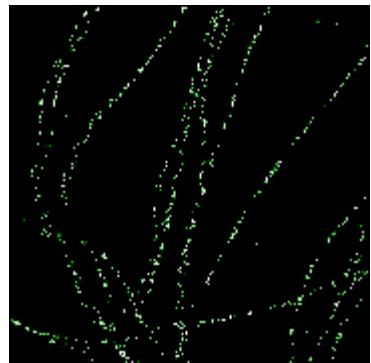

- Multicolor imaging so far challenging

- More versatile for multicolor imaging

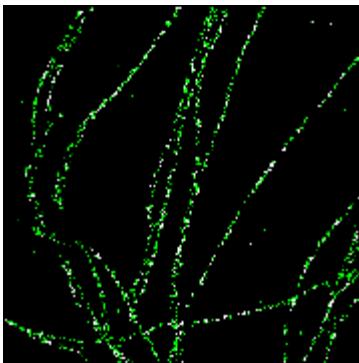

# Effective resolution: Density matters

mEos2 labeled microtubule in live S2 cells

60 frames/sec  
1200 frames/step (20 sec time resolution)  
50x real time

# Spatial-temporal resolution trade-off

Assuming:

1 molecule occupies  $500 \times 500 \text{ nm}$

On average **0.1 point** /  $0.25 \mu\text{m}^2 \cdot \text{frame}$

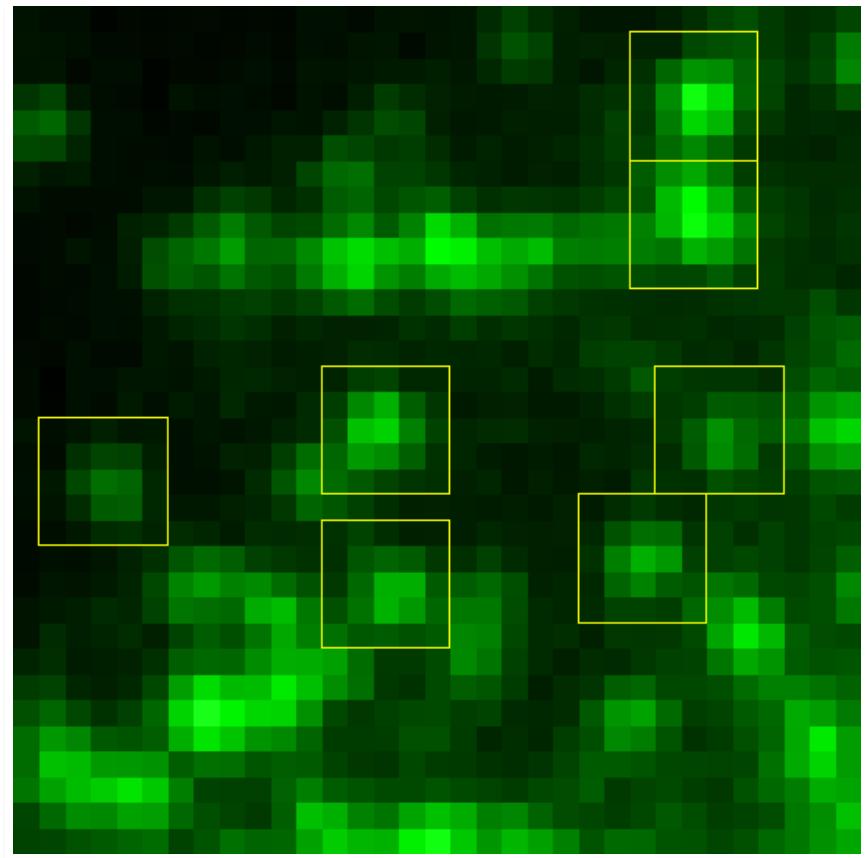

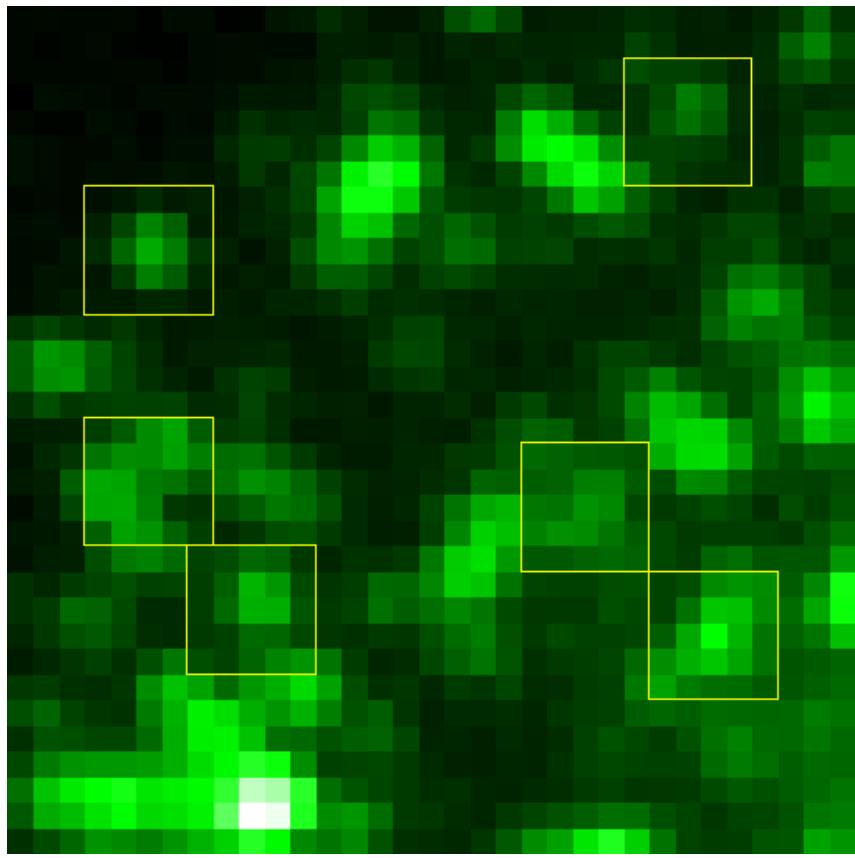

$\downarrow$   
70 nm resolution  $\equiv$  2000 frames

$\downarrow$   
**100 fps** = 20 sec time resolution

1000 fps

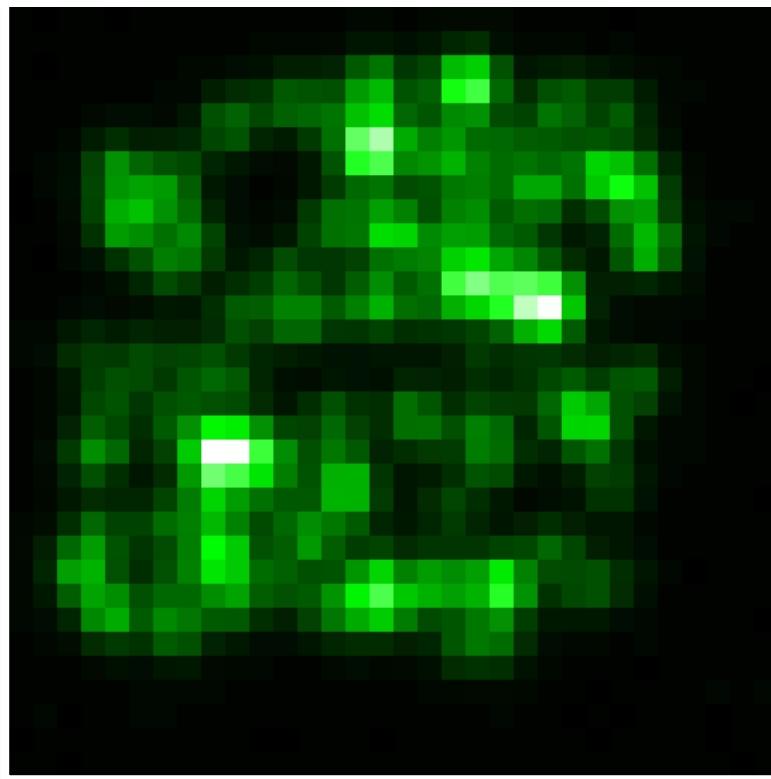

# More molecules per camera image?

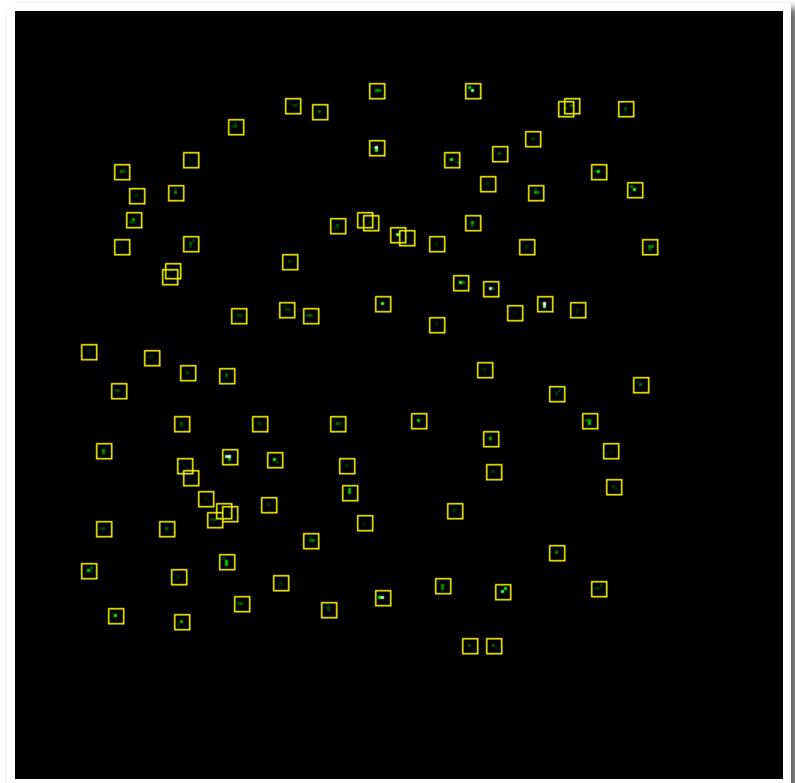

# Molecule identification by compresses sensing

Simulated camera image

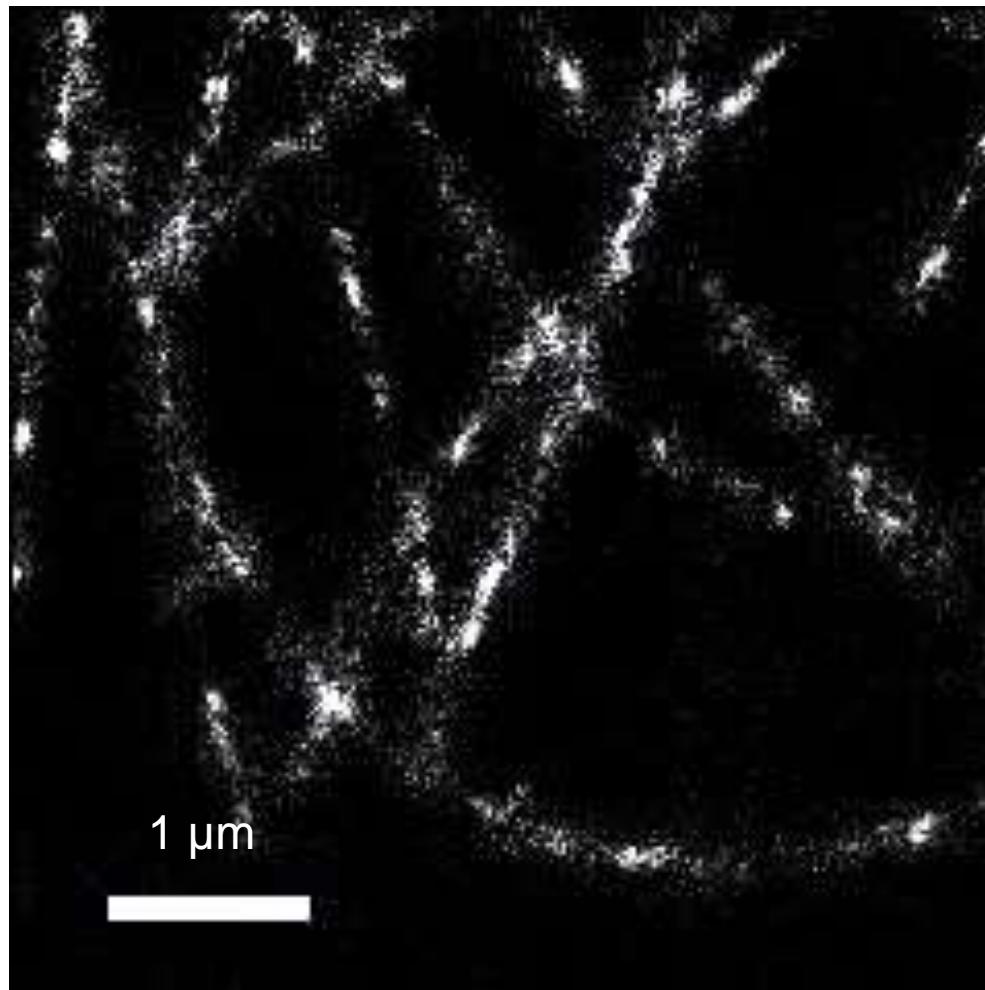

Compressed sensing

94 recovered

100 molecules

# Fast live cell imaging by compressed sensing

mEos2-tubulin in S2 cell, 3 sec time resolution, 11.8x real time

# Fast... and even faster?

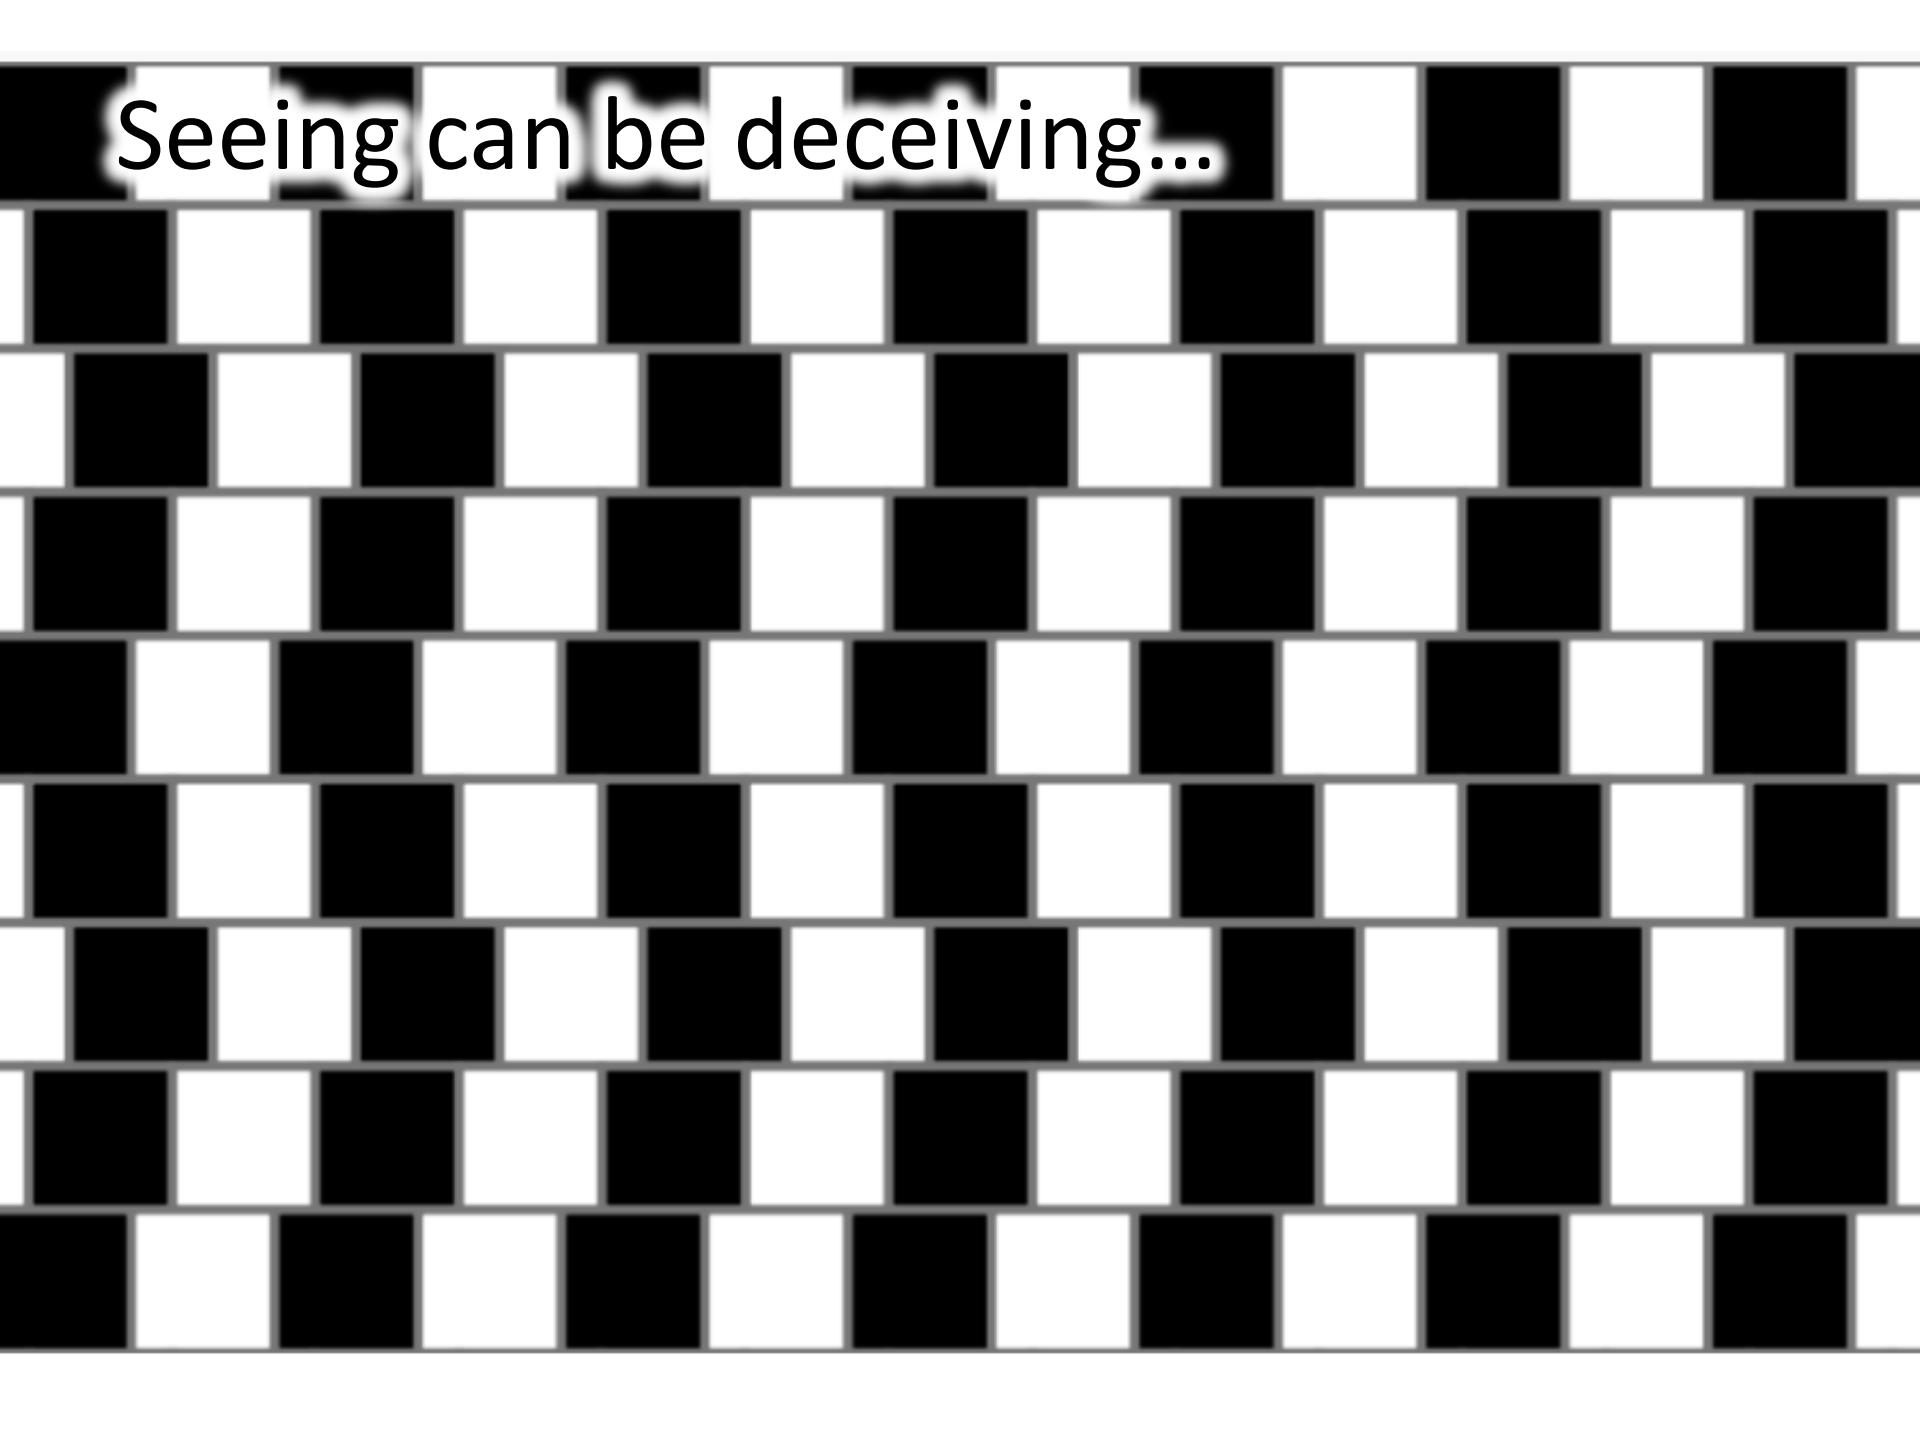

# Comparison of time resolution

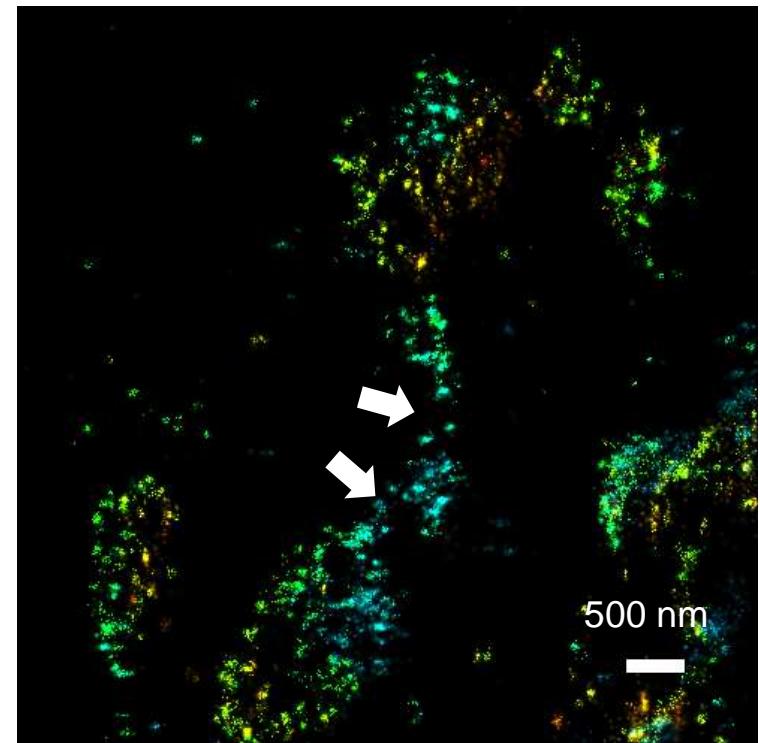

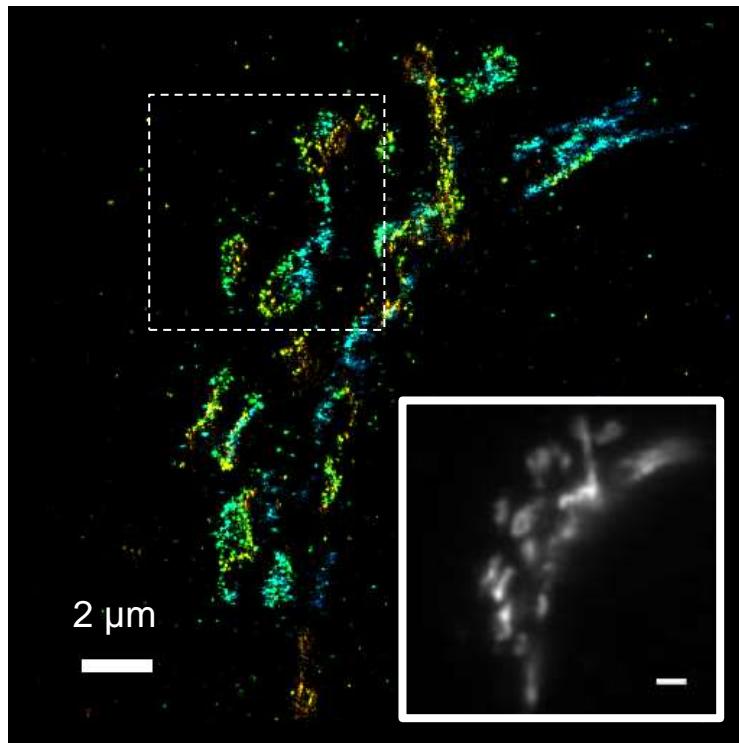

2D		Spatial resolution	Time resolution
SIM	Wide-field	120 nm	9 frames (0.09 sec)
STED	Scanning	60 nm	$1 \times 2 \mu\text{m}$ : 0.03 sec $10 \times 20 \mu\text{m}$ : 3 sec
STORM/PALM	Wide-field	60 nm	3000 frames (3 sec)

3D		Spatial resolution	Time resolution
SIM	Wide-field	120 nm	15 frames x 10 (1.5 sec)
STED	Scanning	60 nm	$1 \times 2 \times 0.6 \mu\text{m}$ : 0.6 sec $10 \times 20 \times 0.6 \mu\text{m}$ : 60 sec
STORM/PALM	Wide-field	60 nm	3000 frames (3 sec) – no scan!

Seeing can be deceiving...

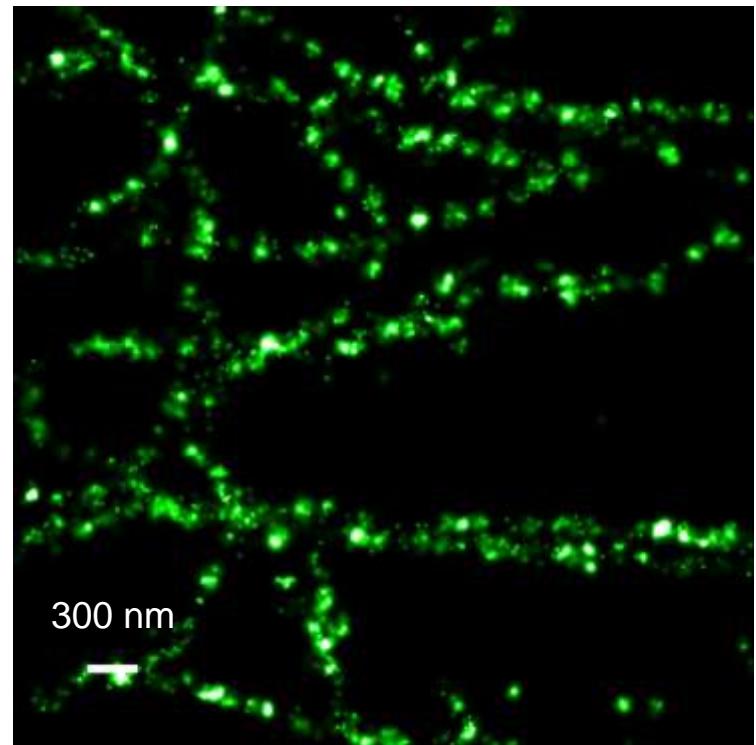

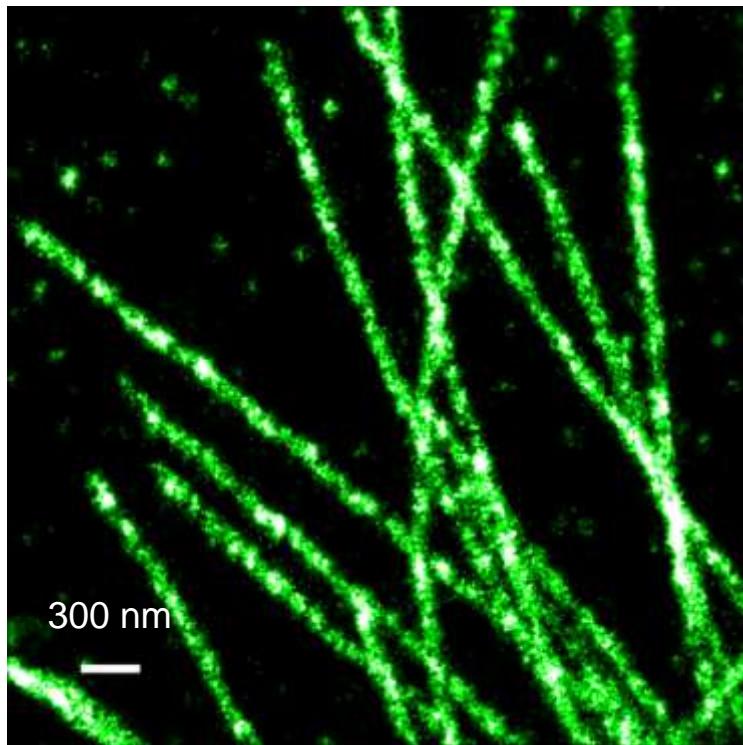

# Super-resolved artifacts: sparse labeling

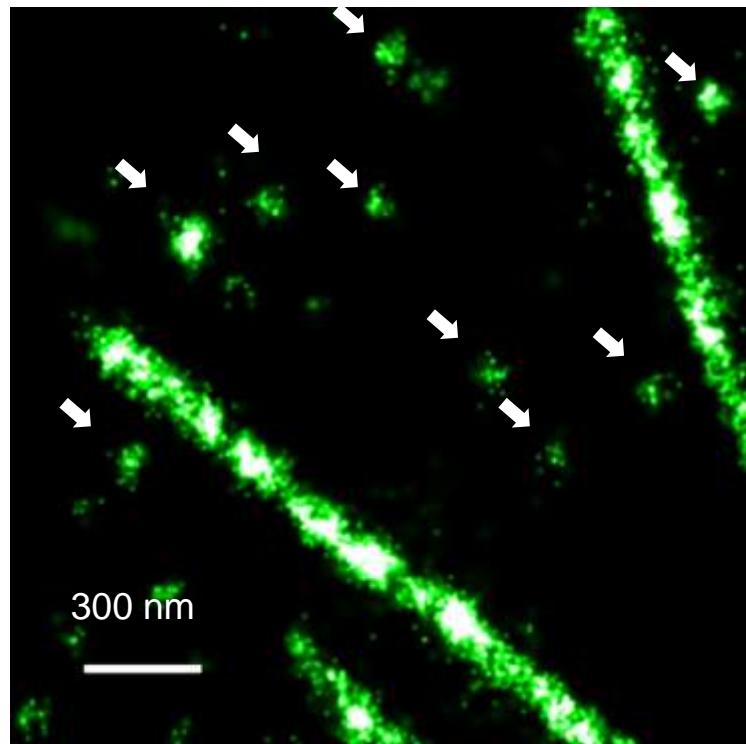

Golgi: Giantin immunofluorescence

# Super-resolved artifacts: poor fixation

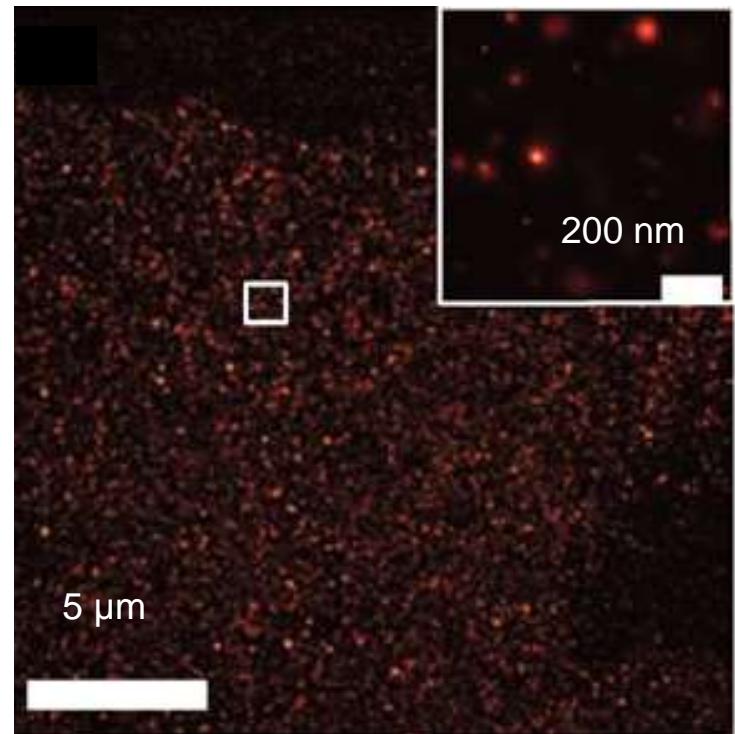

Microtubules: good and bad fixation

# Super-resolved artifacts: clustering

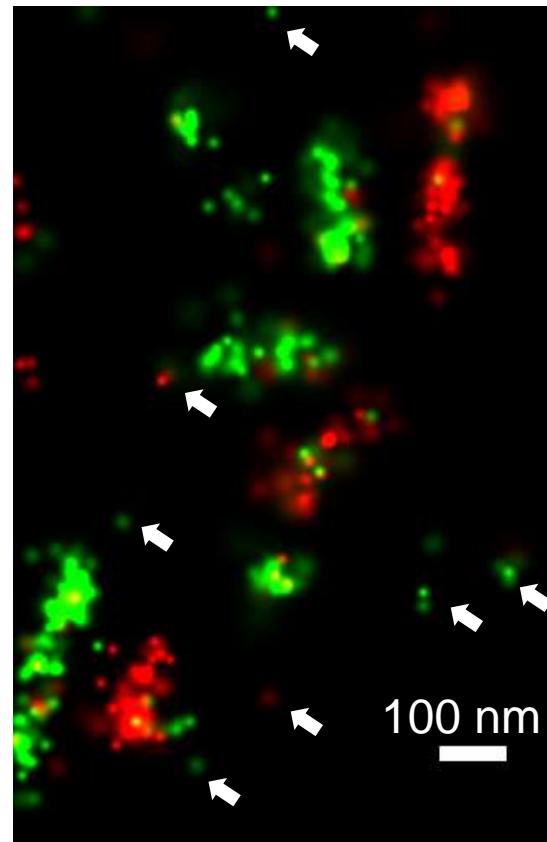

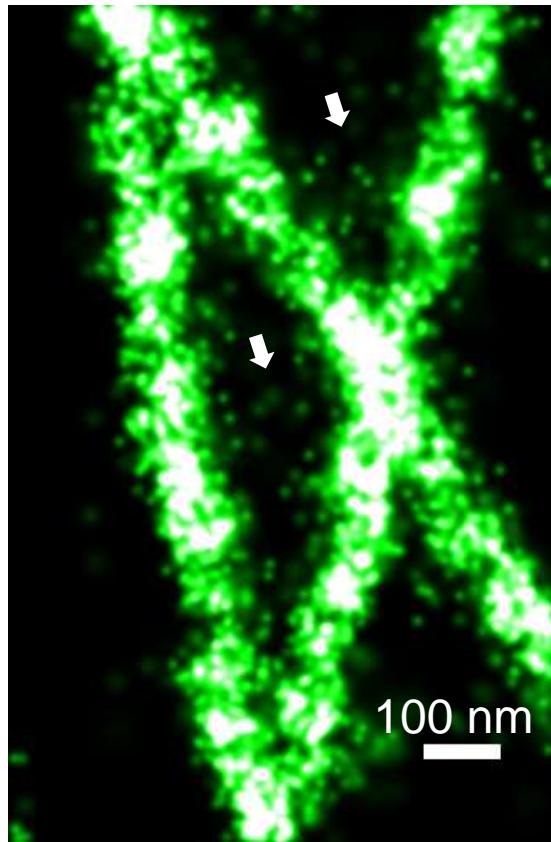

Clusters from single antibodies

Clusters from blinking FPs

# Super-resolved artifacts: “noise” points

Noise from misidentified molecules, crosstalk and background
